

Forward Deployed Engineer – Intern (Full Stack, AWS & AI Applications)

Role Overview

We're looking for a hungry, hands-on Forward Deployed Engineer Intern who wants to build real, end-to-end applications — not just tickets in a backlog. This role is for freshers and recent graduates who move fast, love figuring things out on their own, and want deep exposure to how a product actually gets built, deployed, tested, and shipped to real users.

You'll work directly with customers and internal teams to turn requirements into working software — owning a feature from design through deployment on AWS.

What You Will Learn & Do

- **End-to-End Ownership:** Build features across the full stack — frontend, backend, database, and deployment — and see them go live.
- **Cloud Deployment:** Get hands-on with AWS (EC2, S3, Lambda, RDS, or similar) to deploy and manage real applications.
- **Testing & Quality:** Write unit, integration, and end-to-end tests; learn how professional teams catch bugs before customers do.
- **Customer-Facing Problem Solving:** Work closely with real use cases and requirements, adapting solutions on the fly like a true "forward deployed" engineer.
- **AI-Powered Features:** Integrate LLMs (Claude/Anthropic) into applications where it makes sense — automation, smart workflows, and intelligent UX.
- **Collaborative Engineering:** Participate in code reviews, version control workflows, and agile team practices.

What We Are Looking For

- **Academic Background:** Currently pursuing or recently completed a degree in Computer Science, IT, or a related technical field.
- **Core Coding Skills:** Solid grasp of JavaScript/TypeScript, HTML, and CSS, with working knowledge of building applications (React, Node.js, or similar).
- **Cloud Curiosity:** Basic understanding of cloud concepts (hosting, deployment, storage) — AWS exposure is a big plus.
- **Testing Mindset:** Awareness of why testing matters and willingness to learn testing frameworks and best practices.
- **Database Basics:** Familiarity with fundamental database concepts (tables, rows, collections, queries).

- **Out-of-the-Box Thinker:** You don't wait to be told exactly what to do — you dig in, explore, and figure things out.
- **Genuine Curiosity:** Real enthusiasm for technology, AI, and how systems work end-to-end — not just checking a box on a resume.

Ideal Skills (Not Required)

- Exposure to AWS services (EC2, Lambda, S3, RDS, etc.).
- Familiarity with testing frameworks (Jest, Mocha, Cypress, or similar).
- Git/GitHub basics.
- Interest in AI/LLM integration and automation.

Who Should Apply

- **Only freshers and recent passouts** — no prior full-time work experience required.
- People who are self-starters, resourceful, and genuinely excited to learn by building — not just following instructions.

Why Join Us?

- **Real Ownership:** Work on live, real-world applications end to end — not isolated exercises.
- **Mentorship:** Learn directly from experienced architects on modern cloud, testing, and AI patterns.
- **Career Launchpad:** Build a portfolio spanning full-stack development, cloud infrastructure, and applied AI — some of the most in-demand skills in the market today.
